

Temescal Lake Maintenance Activities

Tuesday 4/30/2024

Attention Anglers: Fishing may be disrupted

Cyanobacteria thrive in water with high nutrient levels. We will apply a clay-based product to the lake that binds excess nutrients. This treatment is environmentally safe, effective, and will ultimately promote a healthier lake ecosystem that is safer to recreate in.

Aging reservoirs, like Temescal Lake, contain excess levels of nutrients and require these ongoing maintenance activities.

Product information	Tuesday 4/30/2024
EutroSORB (Lanthanum clay compound that binds phosphorous in the water and sediments)
